

# Two Functional MDD's for the Price of One - Part 2

TODO add list of authors

November 6, 2019

# Outline

- 1 Symphony - Modeling Language for Non-Linear Optimization
- 2 Sample Problem 1
- 3 Sample Problem 2 (Bounded Parameters)
- 4 Sample Problem 3 (Constraint Programming)
- 5 Instruction Scheduling Intro
- 6 Hashed Expression - Symphony's Backend
- 7 References

# Symphony - Modeling Language for Non-Linear Optimization

- Models linear and non-linear programming problems
- Simple declarative language
- Support for bounded parameters and constraint programming
- Generates performance oriented c code
- Solver Agnostic (plug into your solver of choice)

# Instruction Scheduling

## Problem

Given a set of instructions and dependencies, designate an order (find a **schedule**) satisfying the dependencies and optimizing performance

## Known NP-Complete

Practically solved by

- **Heuristics**
- **Approximation Algorithms**

# Example Instruction Dependency DAG

Figure: Vector Instruction Dep. Graph

# Types of Scheduling Algorithms

- **Basic Block:** break code into blocks within branches (most commonly performed scheduling)
- **Global Scheduling:** schedule across basic block boundaries
- **Modulo Scheduling:** schedules basic blocks inside of a loop, seeking to optimize by interleaving iterations
- **Trace Scheduling:** tries to optimize control flow by predicting routes taken on branches

# Graph Colouring

Figure: Register Allocation via Graph Coloring

Find a  $k$ -Colouring for the dependency graph, where  $k = \#Registers$

# Hashed Expression - Symphony's Backend
